Executive summary

Census 2001 was the second census to be carried out in a democratic South Africa to provide demographic and socio-economic data required to inform policy decision-making as well as ascertain the achievements made in the provision of basic services to the people. Data on disability were collected as part of this important endeavour. This report highlights the key findings on disability emanating from the analysis of these data.

Since 1994 the government has formulated various policies to address the inequities which were embedded in the policies pursued by the apartheid regime. The policies have focused on empowering previously disadvantaged groups including women, children and disabled persons. These policies are contained in various policy documents such as the Reconstruction and Development Programme (RDP), Growth, Employment and Redistribution (GEAR) and the Integrated National Disability Strategy (INDS). The need for relevant data and information on prevalence and experience of disability has increasingly grown as a result of the need to monitor and evaluate the impact of these policies.

The data collected in Census 2001 indicates that there were 2 255 982 people with various forms of disability. This number constituted 5% of the total population enumerated in this census. Of this number, 1 854 376 were African, 168 678 coloured, 41 235 Indian/Asian and 191 693 white. The number of females affected was 1 173 939, compared to 1 082 043 males.

The provincial prevalence levels show that the most affected province was Free State with a prevalence of 6,8% and the least affected Gauteng (3,8%). The prevalence increased by age from 2% in the age group 0-9 years to 27% in the age group 80 years and above. Those who had post-secondary education had the lowest prevalence (3%) compared to those who had no schooling (10,5%), primary level (5,2%) and secondary level of education (3,9%).

The prevalence of sight disability was the highest (32%) followed by physical disability (30%), hearing (20%), emotional disability (16%), intellectual disability (12%) and communication disability (7%).

A comparison of the demographic and socio-economic characteristics of disabled and non-disabled persons shows that disabled persons were on average older. About 30% of disabled people had no education while only 13% of the non-disabled population fell in this category. However, the most affected population group in this regard were Africans.

The findings with regard to access to basic services (housing, water and electricity for lighting) indicate that 53% of households headed by disabled persons lived in houses or brick structures – nearly the same as the percentage of households headed by non-disabled persons (56%). A significant proportion (37%) of households headed by disabled persons lived in traditional dwellings or huts and informal dwellings/ shacks. About 78% of households headed by disabled persons had access to piped water compared to 85% of those headed by non-disabled persons. As far as electricity for lighting is concerned 62% of households headed by disabled persons used this service.

The above findings provide useful information on the prevalence of disability in the country. Apparently, disabled persons are disadvantaged as far as access to educational and employment opportunities is concerned. The profiles by type of disability underscore the need to have preventive and rehabilitation programmes that target the most affected groups. These trends in the findings support other sources of data on the prevalence of and the experience of disability, such as the *1998 Baseline survey on disability* (Schneider et al. 1999).

Chapter 1: Background

1.1 Introduction

Census 2001 was the second census to be carried out in the country since 1994 as part of government's commitment to ascertain the impact that various social and economic programmes have had on the lives of the population. It was carried out in October 2001 on a *de facto* basis (according to where people were on the night of the 9/10 October). Apart from collecting data on the population size, composition and distribution, this census solicited data on pertinent social and economic variables. Data on disability was included in the package.

The advent of democracy in 1994 was marked by conscious attempts to redress the socially engineered inequalities of the apartheid era. One of the paramount objectives of the democratic government has been the enshrinement of fundamental human rights of all South African citizens. Various policies and programmes aimed at empowering previously disadvantaged groups, including women, children and disabled persons, have been put in place as part of the overall socio-economic development strategy as reflected in the Reconstruction and Development Programme (RDP) and the Growth, Employment and Redistribution (GEAR) strategies of the government.

A number of major population issues have been raised as areas of concern. These population issues have been identified as limiting the attainment of the above development objectives. They also constitute obstacles to improving the quality of life of the disadvantaged groups. One such disadvantaged group is that of disabled persons. However, the progress that has been made to date has been uneven. One of the reasons for this is the limited, or at worst irrelevant range and availability of statistics and other information for input into social policy decisions regarding disabled persons. Another reason is the fact that disability issues have always been viewed within a health and welfare framework. This has led to the failure to integrate disability into mainstream government statistical processes as highlighted in the Integrated National Disability Strategy (INDS) 1997. This strategy paper presents a blueprint for government national departments to integrate the needs of the disabled into their policies, procedures, practices and programmes.

The INDS emphasises the attainment of a good and equitable quality of life for disabled persons in the country. Its main objectives reflect two main pillars. One pillar is the systematic integration of disabled persons into all policies, plans, programmes and strategies aimed at enhancing the quality of life of all disabled persons at all levels, within all sectors and institutions of government. The other is a coordinated, multi-sectoral, interdisciplinary and

integrated approach in designing and implementing programmes and interventions that affect major national population concerns. These two pillars need to be reliable and informed by up-to-date information on the status and prevalence of disability in the country.

1.2 Prevalence of disability

In the wake of South Africa's democracy and as the need arose to understand the prevalence of disability in the country, some useful statistics from the United Nations Development Programme (UNDP) and the Central Statistical Service (CSS) provided some insights into the problem. While the UNDP estimated that in 1990, 5,2% of the world's population was experiencing moderate to severe disability, for South Africa the figure stood at approximately 5% in 1995.

Although the INDS paper has brought with it an increased awareness of the need to monitor the situation of persons with disabilities, little is known about the nature, determinants and prevalence of disability in the country. The data collected in the 1996 census indicated that 6,7% of the population was disabled. In the 1998 baseline national survey on disability the data provided an age-weighted count of 5,9% of the population as being disabled. The data collected in Census 2001 provided another opportunity to ascertain the number of disabled persons, their demographic and socio-economic characteristics and their access to basic services.

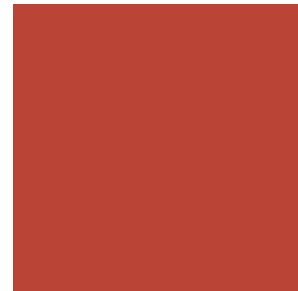

1.3 Information needs for policy formulation

According to the United Nations (2002), more than half a billion people worldwide are disabled as a result of mental, physical or sensory impairment. Approximately 80% of these disabled persons live in developing countries. Disabled persons more often than not suffer from discrimination because of prejudice or ignorance, and may also lack access to essential services. The 'silent crisis', as the United Nations refers to it, affects not only disabled persons themselves and their households, but also the economic and social development of entire societies where a significant reservoir of human potential often goes untapped.

As is the case in many sub-Saharan African countries, South Africa is beginning to recognise the rehabilitation needs and civil rights of persons with disabilities, the impact of impairment, activity limitations and participation restrictions as well as the resulting disadvantage they experience on national indicators of health, education and economic prosperity. Information needs range from basic counts of persons with disabilities in the population to information on more complex issues such as the difference in the quality of life between persons with and without disabilities.

Debates among key stakeholders on issues of disability have increasingly noted the lack of sufficient and accurate data on disability. The unreliability of statistics is due to a number of factors. These include different definitions of disability, different survey methodologies used to collect information, negative traditional attitudes towards people with disabilities, a poor service infrastructure for persons with disabilities in underdeveloped areas, and violence levels (in particular areas and at particular times) – all these have impeded the collection of data, thereby affecting the overall picture.

In recent decades, the collection of data and the production of statistical information on topics relevant to disability have proliferated. Although, in many instances, the information produced fails to meet the needs of policy-makers due to the absence of common terminology or standard

procedures and guidelines, more often than not the most basic question commonly asked is: How many persons with disabilities are there in the population? Once this basic question is answered, a host of additional questions arise:

- What types of disabilities do persons in the population have and what is the prevalence of each type?
- How does prevalence of disability vary by age, gender and geographic area?
- How many persons with disabilities are without access to the special appliances or aids that they need?
- What percentage of school-going-age children with disabilities are in school?
- What percentage of adults with disabilities is economically active? How does this compare with the percentage for non-disabled adults or the general population?
- How many people with disabilities receive social services and how many require full-time care from a family member or some other person?
- Can persons with disabilities use public transport available to the general public? If not, what are the reasons that they cannot?
- What are the major barriers in the social and physical environment that create exclusion for persons with disabilities?

These questions highlight the increasing need for statistics on disability to support effective policy formulation, programming and implementation. This report utilises the information collected in Census 2001 to provide answers to some of these questions.

1.4 Objectives of the report

There is still a dearth of information on the nature, prevalence and more importantly the profile of persons with disabilities in the country. The lack of reliable information impacts negatively on the planning for the provision of services to disabled persons in the country as well as the creation of an enabling environment for the equalisation of opportunities.

The report focuses on the number of persons who were affected by type of disability, age, sex, province and population group. It also provides insights into the socio-economic profile of disabled persons with respect to their level of education, labour force participation and access to basic amenities and services. It is hoped that the findings emanating from the above analyses will provide input into the achievement of the objectives of the INDS paper.

1.5 Scope and limitations of the report

This report is limited by a number of factors. Claims have often been made to the effect that the inclusion of a question on disability in a census questionnaire is not effective due, in part, to the negative connotations and stigma attached to disability. Such a topic is best dealt with by professional interviewers in the less rushed context of a survey.

Firstly, census data do not, therefore, provide the government with an accurate assessment of the prevalence of disability, making targeted intervention virtually impossible. Notwithstanding this assertion, this report attempts to close this statistical information gap.

Secondly, the definition of disability varies. No international consensus has been reached on the definition of disability. One of the reasons for the failure to integrate disability into mainstream government statistical processes is the fact that statistics on the prevalence of disability tend to be unreliable. People who have an interest in issues pertaining to disability have for some time now struggled with the issue of defining disability. Policy-makers and service providers are usually quick to point out not only the advantages, but in fact the necessity, of categorising disabled persons into clearly defined groups for the purposes of service delivery, education, social security and employment equity.

In the case of South Africa, the question posed in Census 2001 on disability differed considerably from the question posed in Census 1996. The categories were not identical, and moreover the Census 2001 question had the added dimension of "full participation in life activities", which expands the concept of 'disabled' from a narrow focus on impairment to a broader focus on human functioning in a social context.

In 1996, the question on disability was posed thus:

Does the person have a serious sight, hearing, physical or mental disability? If yes, circle all applicable disabilities for the person: Sight 1; Hearing/Speech 2; Physical disability 3; Mental disability 4.

In comparison, the disability question posed in 2001 read thus:

Does the person have any serious disability that prevents his/her full participation in life activities? None 0; Sight 1; Hearing 2; Communication 3; Physical 4; Intellectual 5; Emotional 6.

The discrepancy in the way the questions were posed to respondents in the two censuses makes it difficult to have comparable figures.

The prevalence of disability in the country needs to be reviewed within the context of the fact that in a number of cases, it is suspected that disability as a condition was not noted during the count for a variety of reasons. These reasons could include a misunderstanding by respondents (or even enumerators) on what disability means in terms of the various types. This issue remains a complex one and is compounded by a number of factors some of which are not as yet clearly determined.

1.6 Outline of the report

This report has five chapters.

Chapter one provides background information on the importance of having accurate and relevant data on disability.

Chapter two presents a broad overview of the prevalence of disability in terms of the number of persons affected as well as the types of disabilities.

Chapter three presents the demographic and socio-economic characteristics of disabled persons. To this end, it examines if and to what extent demographic characteristics of persons with disabilities differ from those without.

Chapter four focuses on the access that disabled persons have to basic services.

Chapter five highlights the key findings and points to pertinent policy implications.

Chapter 2: Prevalence of disability: Levels and patterns

2.1 Introduction

This chapter focuses on the prevalence of disability in terms of persons affected and types of disabilities. Household members were asked whether or not they had any serious disability that prevented them from engaging in “*full participation in life activities*”. The types of disabilities covered were sight, hearing, communication, physical, intellectual and emotional. The question did not include a list of examples of what life activities include or do not include, although this was in the enumerator's training manual.

The data referred to in all tables in this report can be found in the appendices at the end.

Note: It is also important to note that all PES-adjusted numbers are rounded to whole numbers. The totals displayed may therefore differ slightly from the sum of the separate numbers.

2.2 Levels and differentials

2.2.1 Prevalence at national level

During Census 2001, a total of 2 255 982 persons reported that they had some kind of disability that prevented them from full participation in life activities. This number constituted 5% of the total population (44 819 778) enumerated in the census.

2.2.2 Prevalence by population group

The African population reported the highest number of disabled people (1 854 376 or 5,2% out of a total of 35 416 166), followed by white (191 693 or 4,5%), coloured (168 678 or 4,2%) and Indian (41 235 or 3,7%) people as shown in Table 2.1. These percentage differences are probably due to a variety of socio-economic and demographic factors, as well as unique social cultural perceptions and inhibitions with regard to reporting on disability.

2.2.3 Prevalence by gender

It is important to recognize that even within the disabled community, there are sectors that experience discrimination and exclusion more acutely than others. Women with disabilities bear the brunt of discrimination and exclusion more acutely than men and tend to have a higher rate

of disability than men, due primarily to women's higher average longevity. The information collected in the 2001 census followed this trend, with 1 173 939 females affected compared to 1 082 043 males. The percentage of females affected was slightly higher than for males in the African and white population groups and slightly lower in the coloured and Indian/Asian population groups, as shown in Table 2.1.

Table 2.1: Number of disabled persons by gender and population group

Population group	N			%		
	Male	Female	Total	Male	Female	Total
African	879 680	974 696	1 854 376	5,2	5,3	5,2
Coloured	88 583	80 095	168 678	4,6	3,9	4,2
Indian/Asian	21 550	19 685	41 235	4,0	3,5	3,7
White	92 230	99 463	191 693	4,4	4,5	4,5
Total	1 082 043	1 173 939	2 255 982	5,1	5,0	5,0

2.2.4 Prevalence by province

Table 2.2 gives the number of disabled persons by province. It shows that KwaZulu-Natal had the highest number (470 588) while Northern Cape had the lowest number (46 973). In terms of prevalence, Free State had the highest percentage (6,8%). The provinces with the lowest prevalence of disability were Western Cape at 4,1% and Gauteng at 3,8%.

Table 2.2: Number of disabled persons by province and sex

Province	N			%		
	Male	Female	Total	Male	Female	Total
Western Cape	96 549	90 301	186 850	4,4	3,9	4,1
Eastern Cape	173 229	199 037	372 266	5,8	5,8	5,8
Northern Cape	23 620	23 353	46 973	5,9	5,5	5,7
Free State	87 758	97 619	185 377	6,8	6,9	6,8
KwaZulu-Natal	219 685	250 903	470 588	5,0	5,0	5,0
North West	105 169	106 054	211 223	5,8	5,7	5,8
Gauteng	164 588	167 023	331 611	3,7	3,8	3,8
Mpumalanga	87 319	94 874	182 193	5,8	5,8	5,8
Limpopo	124 128	144 774	268 902	5,2	5,0	5,1
South Africa	1 082 043	1 173 939	2 255 982	5,1	5,0	5,0

2.2.5 Prevalence by age

The age profile of the disabled population shown in Table 2.3 indicates that 2% of persons aged 0-9 years were reported as disabled. This percentage increased steadily among those aged less than 40 years and increased rapidly thereafter. There were no significant differences between females and males. However, there were variations and similarities in the prevalence of disability among different age groups.

Table 2.3: Number of disabled persons by sex and age group

Age group (years)	N			%		
	Male	Female	Total	Male	Female	Total
0-9	101 838	88 822	190 660	2,2	1,9	2,1
10-19	156 980	148 755	305 735	3,2	2,9	3,0
20-29	149 422	134 806	284 228	3,7	3,2	3,5
30-39	165 153	145 787	310 940	5,4	4,3	4,9
40-49	165 871	168 727	334 598	7,5	6,7	7,1
50-59	142 602	155 928	298 530	10,8	10,3	10,5
60-69	102 815	138 168	240 983	13,7	12,5	13,0
70-79	62 396	111 578	173 974	16,9	17,7	17,4
80+	34 966	81 368	116 334	25,6	27,9	27,2
South Africa	1 082 043	1 173 939	2 255 982	5,05	5,0	5,0

2.2.6 Prevalence by level of education

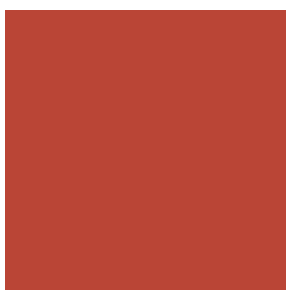

The percentage of disabled persons was highest among those who had no education (10,5%) and lowest among those with higher levels of education, as shown in Table 2.4. This could be a reflection of the fact that disabled persons were often excluded from educational opportunities, as the environment in regular schools does not facilitate integration. Another possible explanation is that low levels of education are generally associated with prevalence of poverty, which in turn renders people more vulnerable to become impaired because of factors such as lack of access to healthcare and rehabilitation. Hence the higher prevalence of disabilities in the group with no education could be as a result of both lack of access to educational opportunities and poverty.

Table 2.4: Percentage of people in each education category who were disabled

Level of education	Male	Female	Total
None	10,7	10,4	10,5
Primary	5,3	5,2	5,2
Secondary	4,1	3,8	3,9
Higher	3,1	2,9	3,0
Other	1,7	1,5	1,6

2.3 Types of disability

This section presents the profile of disabled persons by specific disabilities (including those with multiple disabilities). Each type of disability has a unique impact on an individual's ability to perform certain activities. Hence it is of paramount importance to ascertain the prevalence of the various disabilities at national level and by population group, gender and age.

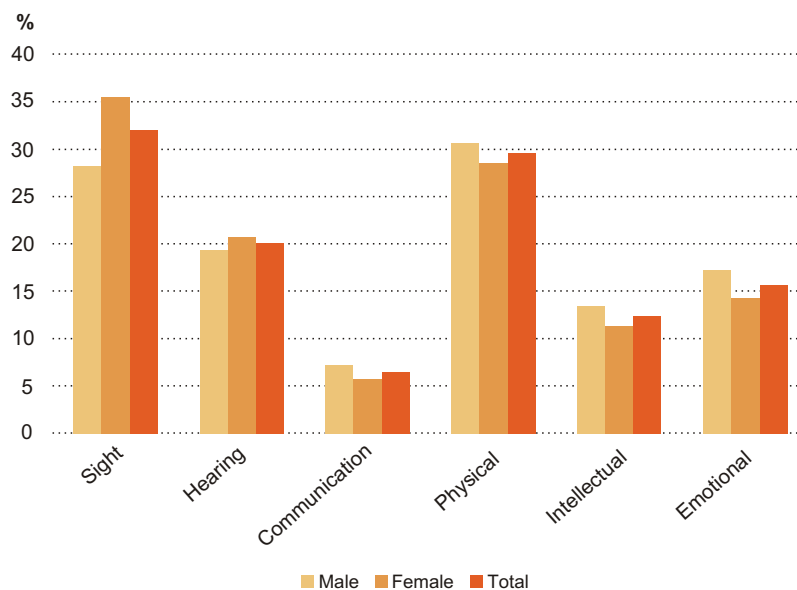

2.3.1 National picture

Table 2.5 and Figure 2.1 provide the percentage of disabled persons who were affected by the various types of disabilities. In addition, Appendix 2 provides the numbers affected as well as the span of the affected persons. The prevalence of sight disability was the highest (32%) followed by physical disability (30%), hearing (20%), emotional disability (16%), intellectual disability (12%) and lastly communication disability (7%). However, although the ranking of disabilities by gender is very similar to the above general ranking, a higher percentage of disabled males (31%) suffered from physical disabilities while 36% of disabled females suffered from problems related to sight.

Table 2.5: Percentage of disabled persons by type of disability

Type of disability	Male	Female	Total
Sight	28,3	35,6	32,1
Hearing	19,4	20,7	20,1
Communication	7,2	5,8	6,5
Physical	30,7	28,6	29,6
Intellectual	13,5	11,3	12,4
Emotional	17,3	14,3	15,7

Figure 2.1: Percentage of disabled persons by type of disability

2.3.2 Population group

The interpretation of data on disability by population group is confounded by the perceptions about the definition of disability and the willingness of the various groups to report accurately (Udjo and Petsoane, 1998). Table 2.6 and Figure 2.2 give the percentage of disabled persons who suffered from the various disabilities by population group. A majority of disabled persons suffered from sight and physical disabilities regardless of population group. However, a substantial proportion of the white population (26%) had a hearing disability compared to 20% for the African, 18% for the coloured and 16% for the Indian/Asian population groups.

Figure 2.2: Percentage of disabled persons affected by specific disabilities by population group

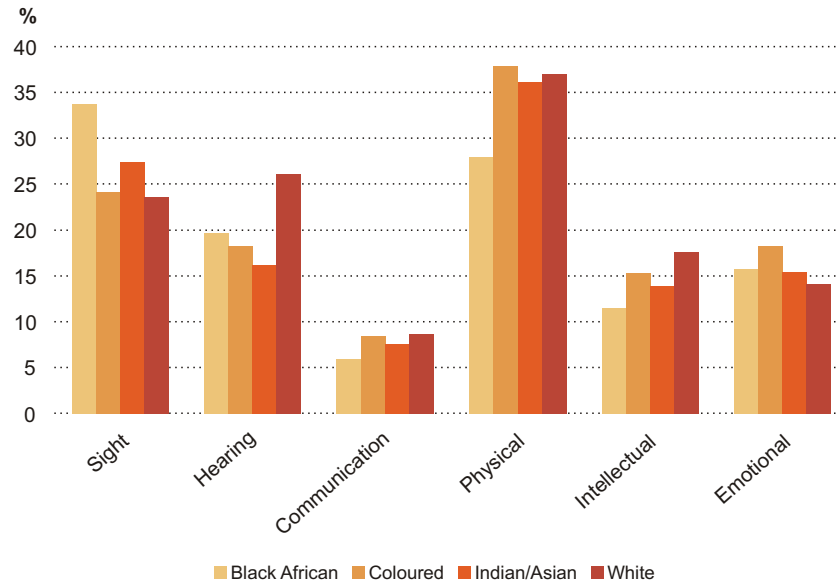

Table 2.6: Percentage of disabled persons affected by specific disabilities by population group

Type of disability	African	Coloured	Indian/Asian	White
Sight	33,8	24,2	27,4	23,6
Hearing	19,7	18,2	16,2	26,1
Communication	6,0	8,4	7,6	8,7
Physical	28,0	37,9	36,1	37,0
Intellectual	11,5	15,3	13,9	17,6
Emotional	15,7	18,2	15,4	14,1

2.4 Summary

The results presented in this chapter show that 5% of the population enumerated in Census 2001 were disabled. Africans had the highest prevalence (5,2%) while Indians/Asians had the lowest (3,7%). Free State had the highest prevalence (6,8%) and Gauteng the lowest (3,8%). The prevalence by age indicates an upward trend from the youngest to the oldest age groups. Most of the disabled persons suffered from sight and physical disabilities. However, caution should be applied in interpreting these results, as these two types of disabilities are the most visible and easily identifiable among the different types reported, and so might have higher prevalence rates for this reason.

Chapter 3: Demographic and socio-economic profiles of disabled persons

3.1 Introduction

In spite of the fact that attention has been appropriately drawn to the need to put into place structures, policies and strategies that promote the social inclusion of disabled persons, minimal success has been achieved. The INDS takes note of the fact that the majority of persons with disabilities in South Africa have been excluded from the mainstream of society and have thus been prevented from accessing fundamental social, political and economic rights.

The exclusion experienced by disabled persons and their families is the result of a range of diverse demographic, economic and social factors. The key forms of exclusion responsible for their disadvantage are poverty, social isolation and the fact that a high number of them are unemployed.

This chapter briefly outlines some of the key differences between disabled and non-disabled persons. Although these differences do not adequately present the extent of exclusion, they do provide some sense of the unique characteristics of disabled persons, which explain their disadvantaged position in society.

3.2 Demographic profiles of disabled and non-disabled persons

3.2.1 Age distribution

The age distributions of disabled and non-disabled persons are shown in Table 3.1 and Figure 3.1. There are striking differences at the younger ages (below 30 years) where 63% of non-disabled persons belong in this age range compared to 35% of disabled persons. This in itself implies that a higher proportion of disabled persons are older. Of the non-disabled population, only 12% were 50 years or older, while 37% of the disabled were in this age category.

Figure 3.1: Percentage distribution of disabled and non-disabled persons by age group

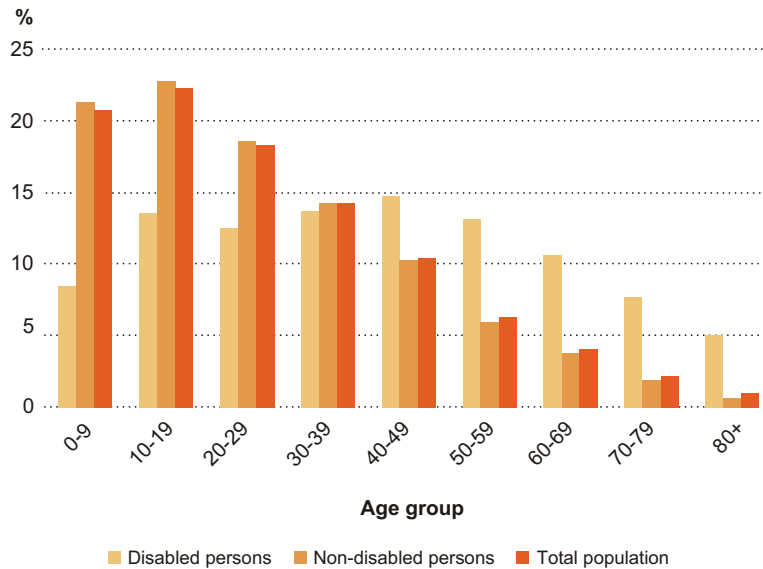

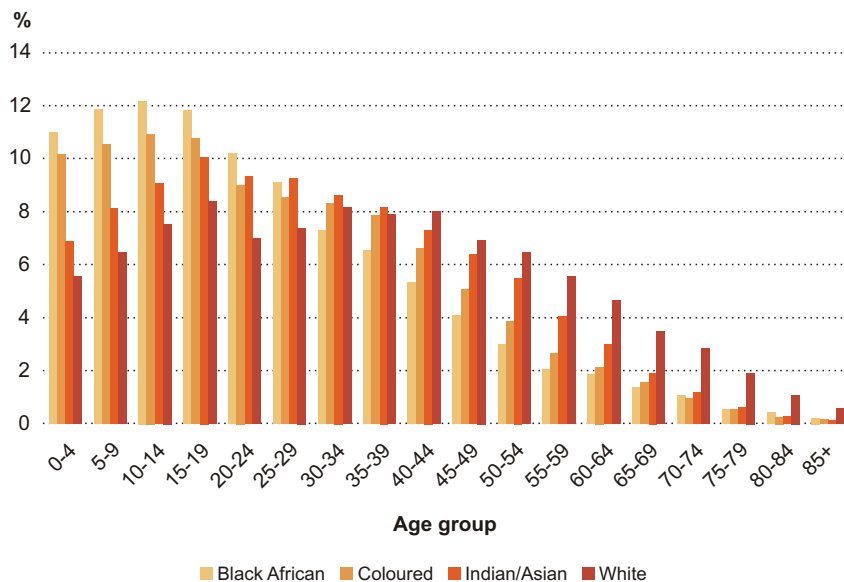

Table 3.1: Percentage distribution of disabled and non-disabled persons by age group

Age group (years)	Disabled persons	Non-disabled persons	Total
0-9	8,5	21,4	20,8
10-19	13,6	22,9	22,4
20-29	12,6	18,7	18,4
30-39	13,8	14,3	14,3
40-49	14,8	10,3	10,5
50-59	13,2	6,0	6,3
60-69	10,7	3,8	4,1
70-79	7,7	1,9	2,2
80+	5,1	0,7	1,0
Total	100,0	100,0	100,0

Figure 3.2 provides the age distribution profile for the disabled persons for the various population groups. The African population had the highest percentage of disabled persons aged below 15 years when compared to the profiles portrayed by other population groups, while the white population had the highest percentages of disabled people starting from the age of 40 years.

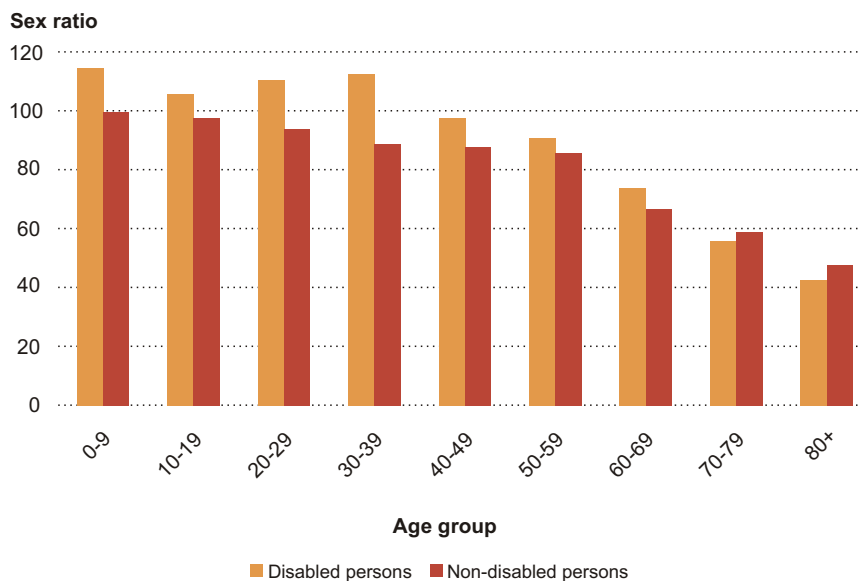

Figure 3.2: Percentage distribution of disabled persons in each population group by age

3.2.2 Sex ratios

Sex ratios provide useful insights into the distribution of the population by gender. The sex ratios by age group for disabled and non-disabled persons are shown in Figure 3.3. The patterns show that there were more males under the age of 40 years who were disabled than females, compared to the pattern portrayed by the sex ratio of non-disabled persons. It is not easy to ascertain the factors underlying the pattern for disabled persons, however, it could be a reflection of social biases in the reporting on disabled females by heads of households, or of factors such as higher rates of violence among males, higher rates of certain childhood conditions in males and the longer lifespan of females.

Figure 3.3: Sex ratios (males : 100 females) of disabled and non-disabled persons by age group

3.3 Socio-economic profiles of disabled and non-disabled persons

3.3.1 Level of education

Figure 3.4 gives the percentage distribution of disabled persons by level of education. About 30% of disabled persons had no schooling compared to 15% of the total population. The high proportion of disabled persons with no schooling could be due to the disadvantaged position they have experienced as far as access to educational opportunities is concerned as well as the dominance of older persons in this group.

Figure 3.4: Percentage distribution of disabled persons by highest level of education

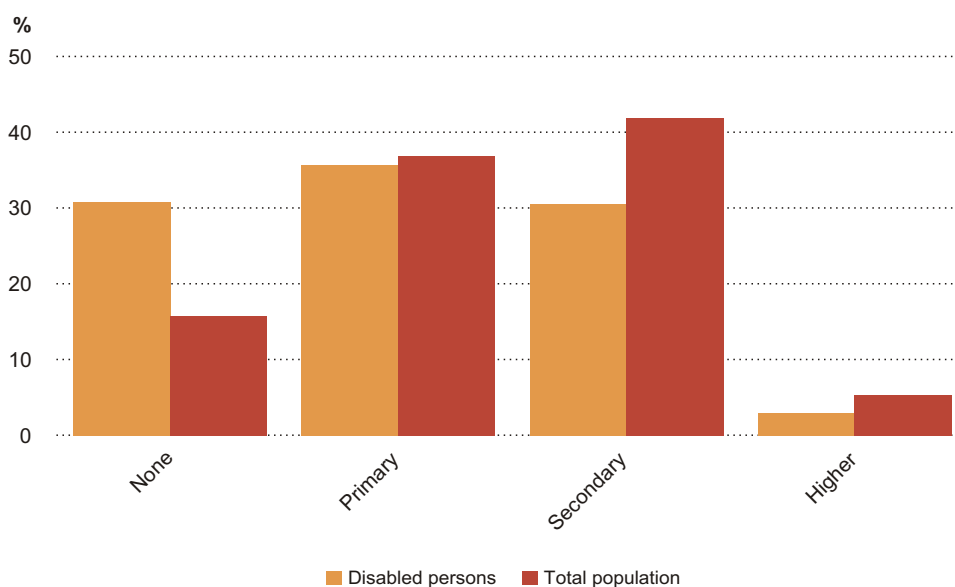

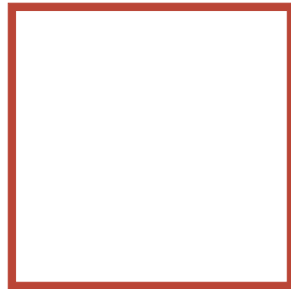

Table 3.2 gives the percentage of disabled persons aged 20 years and above who had never been to school by population group. The figures indicate that Africans were the most affected, while white people had the lowest proportion (7%). However, females were more affected than males regardless of population group.

Table 3.2: Percentage of disabled persons aged 20 years and above who had no schooling by sex and population group

Population group	Male	Female	Total
African	35,3	41,8	38,8
Coloured	19,1	21,5	20,3
Indian/Asian	10,0	22,5	16,0
White	6,3	7,0	6,7
South Africa	30,5	36,7	33,8

3.3.2 Employment status

All persons aged 10 years and above were asked whether they had done any work for *pay* (in cash or in kind), *profit* or *family gain* for one hour or more in the seven days prior to 10 October 2001. The information availed by the respondents in this regard facilitated the categorisation of the respondents into employed and unemployed persons. This section focuses on persons aged 15 to 65 years.

Table 3.3 gives the percentage of disabled and non-disabled persons who were employed in 2001. The figures show that only about 19% of disabled persons were employed compared to 35% of non-disabled persons. Persons aged between 35 and 44 years for both groups reported the highest percentage of the employed. The disadvantaged position of disabled persons could be due to diverse socio-economic and social cultural factors, particularly their low levels of education, discrimination in the labour market and negative attitudes of those they live amongst. These low levels of employment for the disabled population underscore their continued marginalisation and lack of independence within society.

Table 3.3: Percentage of disabled and non-disabled population that was employed in each age group

Age group (years)	Disabled persons	Non-disabled persons	Total
15-19	2,5	3,9	3,9
20-24	12,5	22,0	21,7
25-29	21,0	39,6	38,9
30-34	25,2	49,0	47,9
35-39	25,9	52,2	50,8
40-44	25,7	53,5	51,7
45-49	24,8	51,7	49,5
50-54	21,2	46,8	44,3
55-59	16,6	37,9	35,5
60-65	8,7	19,3	18,0
Total	18,6	34,6	33,7

Table 3.4 shows the profile at provincial level. It shows that the percentage of disabled persons who were employed was relatively low in all provinces compared to that of non-disabled persons.

Table 3.4: Percentage of disabled and non-disabled persons aged 15-65 years who were employed by province and sex

Province	Disabled person		Non-disabled persons		Total	
	Male	Female	Male	Female	Male	Female
Western Cape	28,4	22,7	57,2	42,4	55,8	41,6
Eastern Cape	9,6	8,0	25,3	18,0	24,1	17,4
Northern Cape	21,1	12,2	51,1	31,2	49,1	30,1
Free State	28,7	18,5	42,9	26,9	41,8	26,3
KwaZulu-Natal	17,6	12,9	35,1	23,1	34,1	22,6
North West	22,9	11,6	43,0	22,5	41,7	21,9
Gauteng	30,9	24,1	53,2	37,9	52,3	37,4
Mpumalanga	29,3	16,5	44,5	24,0	43,4	23,5
Limpopo	17,9	12,8	30,2	17,7	29,5	17,5
South Africa	22,0	15,2	42,5	27,0	41,3	26,8

Not only are disabled persons less likely to be employed than non-disabled persons, but within the disabled population women are consistently less likely to be employed. This is possibly a reflection of the double disadvantage which faces disabled women – being disabled and female.

3.4 Summary

The findings documented in this chapter underscore striking demographic and socio-economic differences between disabled persons and non-disabled persons. Disabled persons were generally older, had a higher percentage of persons with no education and a lower percentage of employed persons than those who were not disabled. Furthermore, disabled women experience the disadvantage of being disabled as well as being female, which results in their lower rates of employment.

Chapter 4: Access to basic services

4.1 Introduction

The provision of basic services to the public, particularly disadvantaged groups, has been at the cornerstone of the government's policy as one of the means of improving the standard of living of the people (Policy Co-ordination and Advisory Services, The Presidency, October, 2003) in order to address the appalling conditions inherited from the apartheid regime. The data collected in Census 2001 provided a snapshot of the level of achievement of this policy objective.

The results presented in this chapter are mainly based on 11 205 705 households which exclude households which were enumerated in collective quarters. A total of 894 299 households (455 040 headed by males and 439 259 headed by females) out of 11 205 705 were headed by disabled persons, representing about 8% of all the households.

The main objective of this chapter is to highlight how well households headed by disabled persons have fared in comparison with other households in terms of access to quality housing, potable water, electricity and education.

4.2 Housing conditions

Heads of households were asked to provide information on the following key indicators:

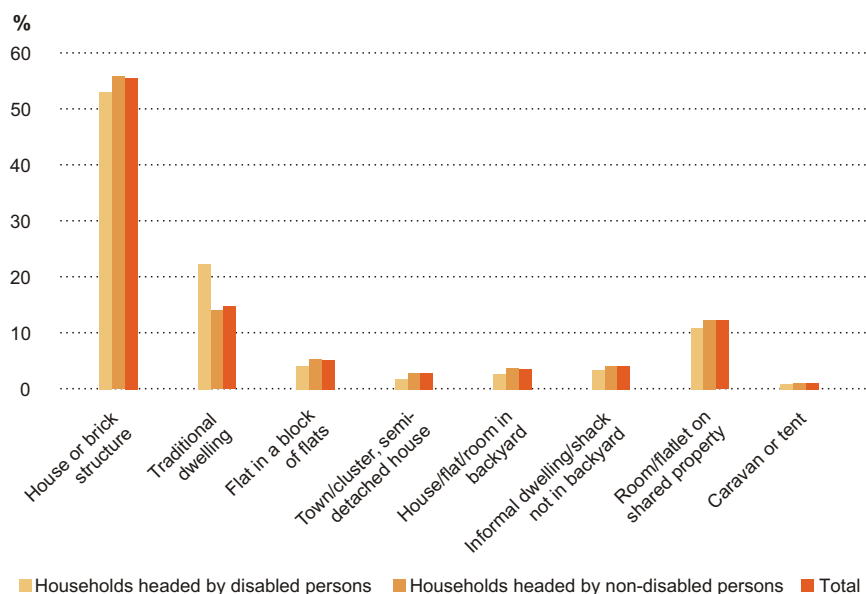

- Type of dwelling or housing unit; and
- Type of tenure.

About 53% of the households headed by disabled persons lived in permanent houses (house or brick structure) compared to 56% of households headed by non-disabled persons as shown in Table 4.1. However, a significant proportion of households headed by disabled persons (22%) lived in traditional types of dwellings/ huts or structures made of traditional materials.

Table 4.1: Percentage distribution of households by type of living quarters

Type of dwelling	Households headed by disabled persons	Households headed by non-disabled persons	Total
House or brick structure on separate stand or yard	53,2	55,9	55,7
Traditional dwelling/hut/ structure made of traditional materials	22,4	14,1	14,8
Flat in block of flats	4,1	5,4	5,3
Town/cluster/semi-detached house (simplex, duplex or triplex)	1,9	2,9	2,9
House/ Flat /room in backyard	2,7	3,8	3,7
Informal dwelling/shack in backyard	3,5	4,2	4,1
Informal dwelling / shack not in backyard	11,0	12,4	12,3
Room/ flat-let not in backyard but on a shared property	0,9	1,1	1,1
Total	100,0	100,0	100,0

Figure 4.1: Percentage distribution of households by type of dwelling

4.3 Housing tenure status

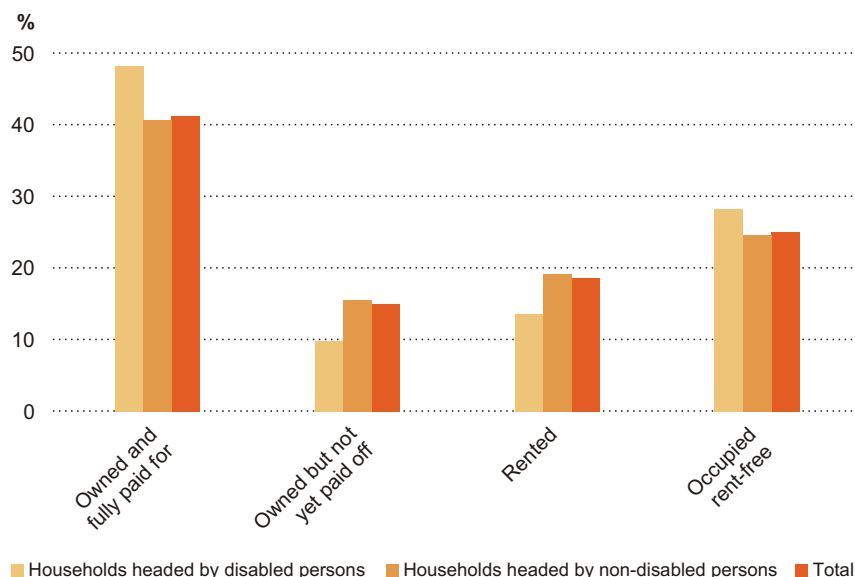

The situation as far as tenure status is concerned was favourable for households headed by disabled persons. About 48% of disabled heads of households owned the houses they lived in, compared to 41% of households headed by non-disabled people.

Another 28% of households headed by disabled people lived in rent-free houses followed by nearly 14% which resided in rented houses, as shown in Table 4.2 and Figure 4.2.

Table 4.2: Percentage distribution of households headed by disabled and non-disabled persons by housing tenure status

Tenure status	Households headed by disabled persons	Households headed by non-disabled persons	Total
Owned and fully paid off	48,3	40,7	41,3
Owned but not yet paid off	9,9	15,5	15,0
Rented	13,6	19,2	18,7
Occupied rent-free	28,3	24,7	25,0

Figure 4.2: Percentage distribution of households headed by disabled and non-disabled persons by housing tenure status

Tables 4.3 and 4.4 give the provincial profiles for households headed by disabled and non-disabled persons respectively. The figures portray a similar pattern nationally and provincially except in Gauteng and Western Cape where a significant proportion (25%) of households headed by disabled persons lived in rented houses. A higher proportion of disabled heads of households in Eastern Cape (34%), Limpopo (36%) and KwaZulu-Natal (30%) lived in rent-free houses when compared to those in similar tenure status nationally (28%). These could be houses built by households from their own resources.

Table 4.3: Percentage distribution of households headed by disabled persons by housing tenure status and province

Province	Owned and fully paid off	Owned but not yet paid off	Rented	Occupied rent-free	Total
Western Cape	39,2	17,7	25,1	17,9	100,0
Eastern Cape	50,1	7,6	8,1	34,2	100,0
Northern Cape	53,3	12,0	13,6	21,1	100,0
Free State	49,5	10,7	14,7	25,0	100,0
KwaZulu-Natal	46,7	9,0	14,1	30,2	100,0
North West	59,2	5,7	8,6	26,4	100,0
Gauteng	35,4	17,4	25,1	22,0	100,0
Mpumalanga	51,9	7,0	12,5	28,6	100,0
Limpopo	56,4	4,6	3,4	35,6	100,0
South Africa	48,3	9,9	13,6	28,3	100,0

Figure 4.3: Percentage distribution of households headed by disabled persons by housing tenure status and province

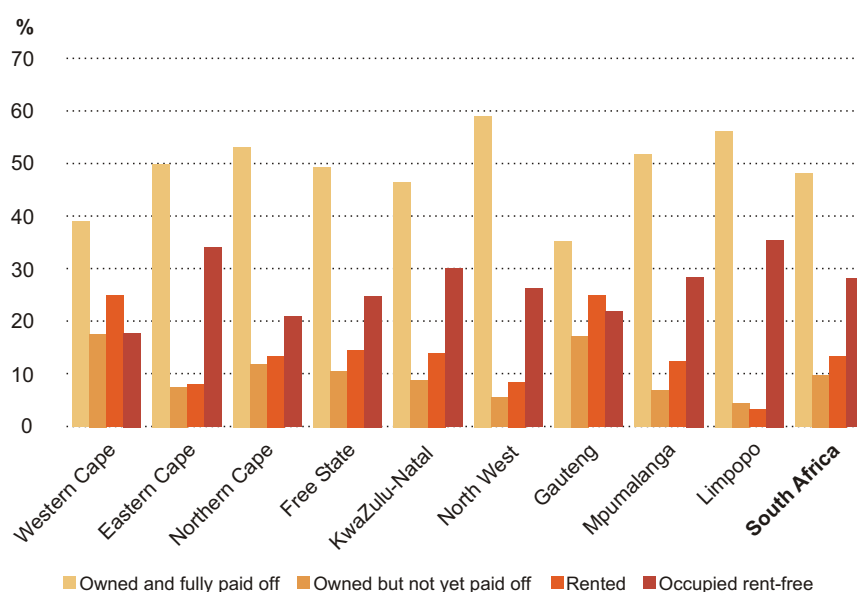

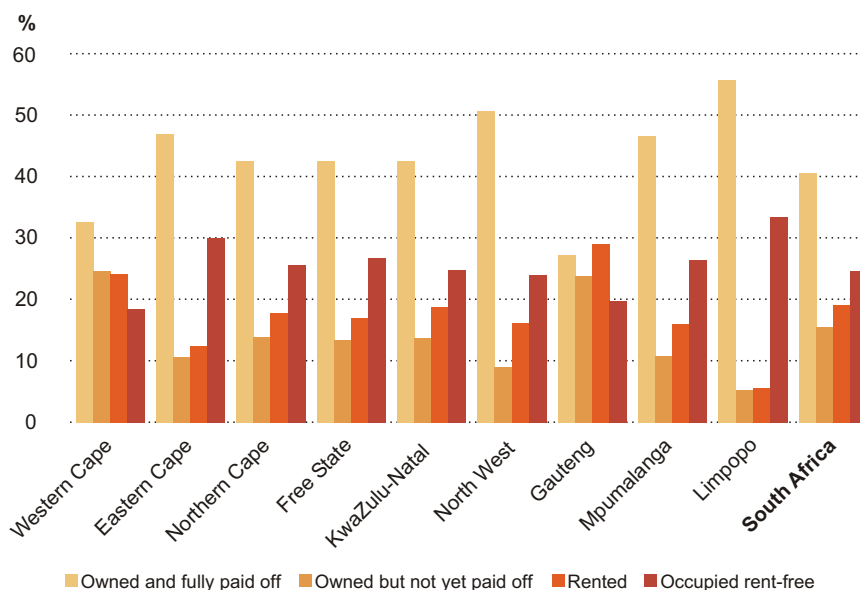

Table 4.4: Percentage distribution of households headed by non-disabled persons by housing tenure status and province

Province	Owned and fully paid off	Owned but not yet paid off	Rented	Occupied rent-free	Total
Western Cape	32,7	24,6	24,2	18,5	100,0
Eastern Cape	47,0	10,7	12,4	30,0	100,0
Northern Cape	42,6	13,9	17,8	25,6	100,0
Free State	42,6	13,5	17,0	26,8	100,0
KwaZulu-Natal	42,6	13,8	18,8	24,8	100,0
North West	50,7	9,0	16,2	24,1	100,0
Gauteng	27,3	23,8	29,1	19,8	100,0
Mpumalanga	46,7	10,8	16,0	26,5	100,0
Limpopo	55,8	5,3	5,6	33,4	100,0
South Africa	40,7	15,5	19,2	24,7	100,0

Figure 4.4: Percentage distribution of households headed by non-disabled persons by housing tenure status and province

4.4 Access to piped water

The percentage of households headed by disabled persons, in each province, that had access to piped water, is presented in Table 4.5. The table shows that about 78% of the households headed by disabled persons had access to piped water compared to 85% of those headed by non-disabled persons. The most disadvantaged households, with regard to access to piped water, were those found in Eastern Cape and KwaZulu-Natal.

Table 4.5: Percentage of households which had access to piped water by province

Province	Households headed by disabled persons	Households headed by non-disabled persons	Total
Western Cape	98,1	98,3	98,3
Eastern Cape	55,5	63,3	62,4
Northern Cape	95,6	96,7	96,6
Free State	95,6	95,7	95,7
KwaZulu-Natal	62,5	74,2	73,2
North West	83,2	86,5	86,2
Gauteng	97,3	97,5	97,5
Mpumalanga	85,2	86,9	86,7
Limpopo	74,5	78,3	78,0
South Africa	77,7	85,1	84,5

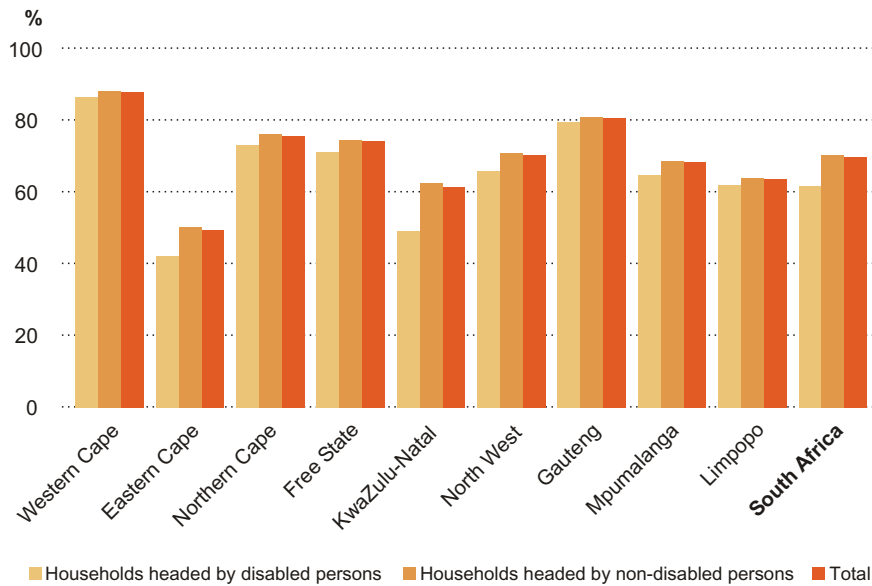

4.5 Access to electricity for lighting

Table 4.6 and Figure 4.5 give the percentages of households headed by disabled persons which mainly used electricity for lighting. The figures show that, nationally, about 70% of all the households mainly used electricity for lighting while the national average for households headed by disabled persons was 62%. The most disadvantaged households headed by disabled persons were those enumerated in Eastern Cape and KwaZulu-Natal, where only 42% and 49% respectively used electricity for lighting.

Table 4.6: Percentage of households which used electricity for lighting by province

Province	Households headed by disabled persons	Households headed by non-disabled persons	Total
Western Cape	86,5	88,1	88,0
Eastern Cape	42,1	50,4	49,5
Northern Cape	73,3	76,1	75,8
Free State	71,2	74,7	74,4
KwaZulu-Natal	49,1	62,5	61,4
North West	65,8	71,0	70,5
Gauteng	79,6	80,9	80,8
Mpumalanga	64,7	68,7	68,3
Limpopo	61,9	64,0	63,8
South Africa	61,8	70,4	69,7

Figure 4.5: Percentage of households which used electricity for lighting

4.6 Access to schooling

One of the major adverse effects of the policies pursued by the apartheid regime was the curtailment of access to educational opportunities for the majority of the population, particularly Africans. The information collected in Census 2001 provided insights into how disabled persons had fared since then with regard to this important social need.

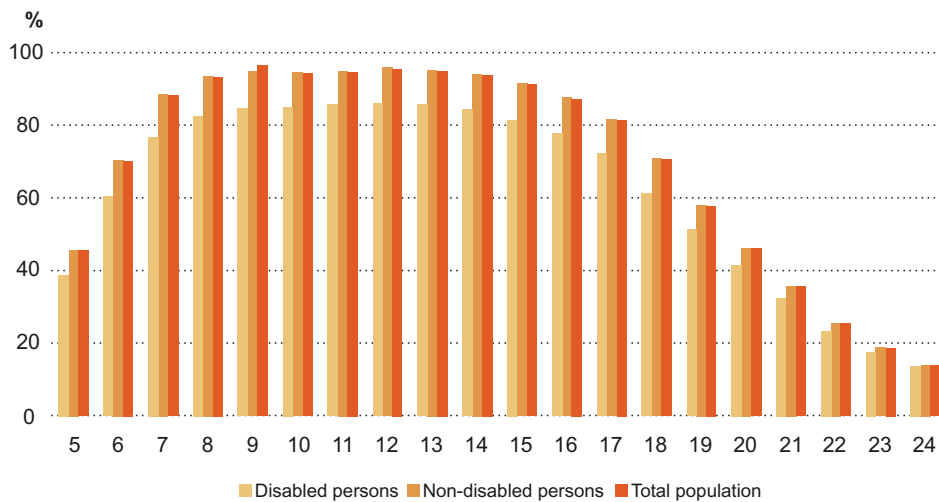

Table 4.7 and Figure 4.6 give the percentage of disabled and non-disabled persons aged 5 to 24 years who were in school. The figures indicate that the disabled persons were relatively disadvantaged compared to the rest of the population. The differences were more pronounced for disabled persons between ages 6 and 18 years (where in most cases the figures were, on average, 10% lower than those of non-disabled persons).

Table 4.7: Percentage of persons aged 5-24 years who were attending school

Age (years)	Disabled persons	Non-disabled persons	Total
5	38,9	45,7	45,6
6	60,5	70,6	70,3
7	76,9	88,7	88,4
8	82,6	93,7	93,4
9	84,8	94,9	96,6
10	85,2	94,6	94,4
11	85,9	95,0	94,8
12	86,1	96,0	95,7
13	85,8	95,4	95,1
14	84,5	94,3	94,0
15	81,5	91,6	91,3
16	77,8	87,8	87,4
17	72,3	81,8	81,5
18	61,3	71,0	70,7
19	51,4	58,1	57,9

21	32,6	35,8	35,7
22	23,4	25,6	25,5
23	17,7	18,9	18,8
24	13,8	14,1	14,0

Figure 4.6: Percentage of disabled and non-disabled persons aged 5-24 years who were attending school

4.7 Summary

This chapter has highlighted the living conditions of households headed by disabled persons. Although 53% of these households resided in permanent houses (house or brick structure), about 37% lived in traditional dwellings/ huts and informal dwellings/ shacks. About 48% of the households owned their houses while 14% lived in rented houses. A majority of the households had access to piped water.

Nationally, about 62% of households headed by disabled persons used electricity for lighting compared to 70% of households headed by non-disabled persons. While the above figures do not differ much from those portrayed for households headed by non-disabled persons, caution should be applied as it could be that households headed by disabled persons, with additional disabled household members, may not have the same experiences as those also headed by disabled persons but with no additional disabled persons. Further analysis of the similarities and differences between these two types of households with disabled members could possibly provide some explanation for the results presented in this chapter.

Chapter 5: Conclusion

5.1 Introduction

The main objective of this report was to ascertain the number of disabled persons, the type of disabilities they suffered from, their demographic and socio-economic profiles and their access to basic services. The report has highlighted the major policies the government has formulated to improve the lives of disabled persons and other disadvantaged population groups. This chapter highlights the key findings and issues that need to be addressed to further improve the welfare of disabled persons.

5.2 Findings

A total of 2 255 982 persons were reported to be disabled in Census 2001. This number should be taken as the lower bound due to the way the question was posed to respondents. Apparently disabled persons who were able to carry out normal activities regardless of their disability might have been excluded.

The above figure constituted 5% of the total population enumerated in the census. The prevalence differed by population group, age and province. Africans had the highest disability prevalence (5,3%) while the Indians/Asians had the lowest (3,5%). Also, the prevalence increased by age. A majority of the disabled persons suffered from physical and sight disabilities. However these should be interpreted with caution because of the issue of the high visibility and easy identification of these impairments compared to other disabilities.

The comparison between disabled and non-disabled persons with regard to age, education attainment and employment indicates that disabled persons were generally older, a significant percentage (30%) had no schooling and about 18% were employed, compared to 35% for the rest of the population.

Although 53% of the households headed by disabled persons lived in houses, about 37% lived in traditional dwellings/ huts and informal dwellings/ shacks. A majority of the households had access to piped water. About 62% of the households headed by disabled person used electricity for lighting compared to 70% of households headed by non-disabled persons. The low learner to teacher ratio of disabled persons (as shown by the low school attendance rates which are lower than non-disabled learners) should not be equated with the notion that disabled people are receiving adequate or quality education.

5.3 Implications

The need for relevant and reliable information on the prevalence of disability to inform policy decision-making to improve the welfare of disabled persons remains a major challenge in spite of the data obtained through Census 2001. This need can possibly be addressed by reviewing the entire data collection systems (censuses and surveys) to ensure that relevant questions are asked. The undertaking of appropriate research is paramount in this regard, especially to help in the interpretation of the findings in this report about the experience of disability and how people respond to the disability question.

Despite the limitations of the data collected in Census 2001, the findings of this report have underscored the disadvantaged position disabled persons are experiencing as far as access to basic services and employment opportunities is concerned. It is crucial that planning at all levels should integrate the needs and challenges faced by disabled persons in the strategies and programmes that are meant to support them.

All PES numbers are rounded to whole decimal numbers. The totals displayed may therefore differ slightly from the sum of the separate numbers
Percentages take into account people with multiple disabilities.

Appendix 4: Number of households by gender of head of household, type of housing unit, access to piped water and energy source for lighting (excluding households in collective living quarters)
